Industrial Internship Report on

"Student Performance Data Analysis"

Prepared by

Sriram S

Executive Summary
This report presents the work completed during the Industrial Internship conducted by Upskill Campus and The IoT Academy in collaboration with UniConverge Technologies Pvt. Ltd. (UCT). The internship focused on solving real-world industrial problems using Machine Learning. Two major projects were completed: 1. Predicting Remaining Useful Life (RUL) of Turbofan Engines 2. Quality Prediction in a Mining Process The first project involved analyzing sensor-based time-series data to predict the remaining operational cycles before engine failure. The second project focused on predicting silica impurity levels in a mining process using industrial process data. The projects were implemented using Python and libraries such as NumPy, Pandas, Scikit-learn, and TensorFlow. Various machine learning and deep learning models were developed and evaluated. This internship provided hands-on experience in industrial data analysis, predictive modeling, and real-world problem-solving, significantly improving both technical and analytical skills.

1. Preface

This four-week internship program provided an opportunity to work on real-world industrial datasets and apply machine learning techniques.

The internship was structured to simulate industry-level project development, including problem understanding, data preprocessing, model building, evaluation, and documentation.

During the internship, I worked on predictive maintenance and industrial quality prediction projects, which are highly relevant in modern industries.

I would like to express my gratitude to Upskill Campus, The IoT Academy, and UniConverge Technologies Pvt. Ltd. for providing this valuable opportunity. Special thanks to my mentors for their guidance and support.

This experience enhanced my understanding of machine learning applications in industry and improved my problem-solving skills.

2. Introduction

2.1 About UniConverge Technologies Pvt. Ltd.

UniConverge Technologies Pvt. Ltd. (UCT) is a company focused on Digital Transformation, Industrial IoT, and AI-based solutions.

UCT develops smart systems such as:

- Predictive maintenance solutions
- Smart factory monitoring systems
- Industrial analytics platforms

These solutions help industries improve efficiency, reduce downtime, and optimize production.

2.2 About Upskill Campus

Upskill Campus provides industry-oriented internship programs in collaboration with companies like UCT.

The platform focuses on:

- Practical learning
- Skill development
- Real-world project experience

2.3 Objective of the Internship

- Apply machine learning techniques to real industrial problems
- Gain hands-on experience with time-series and process data
- Develop predictive models for maintenance and quality
- Improve programming and analytical skills
- Learn project documentation and reporting

2.4 References

- **Numpy Documentation -** https://numpy.org
- **Pandas Documentation -** https://pandas.org
- **Scikit-learn Documentation -** https://scikit-learn.org
- **TensorFlow Documentation -** https://www.tensorflow.org

2.5 Glossary

Term	Definition
RUL	Remaining Useful Life
ML	Machine Learning
EDA	Exploratory Data Analysis
UCT	UniConverge Technologies Pvt. Ltd.
USC	Upskill Campus

3. Problem Statement

Project 1: Turbofan Engine RUL Prediction

Aircraft engines generate large amounts of sensor data. Predicting failures manually is difficult and inefficient.

Problem:
"To predict the remaining operational cycles before failure using sensor data."

Project 2: Mining Process Quality Prediction

Mining industries need to control impurity levels (silica) in output materials.

Problem:
"To predict the percentage of silica in ore concentrate using process data."

4. Existing and Proposed Solution

Existing Solutions

- Manual monitoring of equipment
- Reactive maintenance after failure
- Basic statistical analysis using spreadsheets

Limitations:

- No automation
- Low accuracy
- No predictive capability

Proposed Solution

A machine learning-based system was developed:

For Turbofan Engine:

- Time-series analysis of sensor data
- RUL prediction using ML/DL models

For Mining Process:

- Regression models to predict silica concentration
- Feature analysis for process optimization

5. Proposed Design / Model

5.1 High-Level Diagram

Raw Dataset
↓
Data Cleaning & Preprocessing
↓
Feature Engineering
↓
Model Training (ML/DL)
↓
Evaluation
↓
Prediction Output

5.2 Low-Level Design

Turbofan Engine:

- Load dataset
- Generate RUL labels
- Normalize sensor data
- Apply sliding window

- Train LSTM / Random Forest

Mining Process:

- Load time-series process data
- Remove redundant features
- Train regression models
- Predict silica percentage

5.3 Interfaces

- Python (Jupyter Notebook / VS Code)
- Visualization tools (Matplotlib, Seaborn)
- Machine Learning libraries

6. Performance Test

6.1 Test Plan / Test Cases

Test Case	Description	Expected Result	Status
Data Load	Load dataset correctly	No missing errors	Pass
Model Training	Train ML models	Successfully training	Pass
Predictions	Generate predictions	Accurate results	Pass

6.2 Test Procedure

- Load datasets
- Perform preprocessing
- Train models
- Evaluate using RMSE, MAE
- Validate predictions

6.3 Performance Outcome

Turbofan Project:

- Achieved accurate RUL predictions
- Improved performance using LSTM

Mining Project:

- Successfully predicted silica percentage
- Reduced prediction error using ensemble models

7. My Learnings

- Learned real-world machine learning workflow
- Gained experience in time-series analysis
- Improved skills in data preprocessing and feature engineering
- Learned model evaluation and optimization
- Developed strong problem-solving abilities
- Improved technical documentation skills

8. Future Work Scope

- Deploy models using web applications (Flask/Streamlit)
- Integrate real-time sensor data
- Improve model accuracy using advanced deep learning
- Apply the system to other industrial domains
